1

Merge Columns

If you want to combine **multiple** columns into a **single column**, you can use the **Merge Columns** option. By default, the Merge Columns option is disabled; it only becomes enabled once you select more than one column (using CTRL + Click).

Select multiple columns
(CTRL + Click) to enable
Merge Columns.

How to Use – Merge Columns

Country	Product	Merged
Canada	Laptop	Canada - Laptop
Germany	Mouse	Germany - Mouse
France	Keyboard	France - Keyboard

Merge Columns
Combine the selected columns into one column.

You can choose a separator (e.g., space, hyphen, comma, etc.) while merging.

2

Extract Option in Power Query

Extract is an option in Power Query (under the **Transform** tab, for text columns) that lets you pull out specific characters from a text column, instead of keeping the entire text. You can extract the first few characters, last few characters, a specific range, the text length, or text between two **delimiters** — helpful when you only need a part of the value, not the whole thing.

Available Options:

- Length
- First Characters
- Last Characters
- Range
- Text Before Delimiter
- Text After Delimiter
- Text Between Delimiter

2.1

Length

Returns the number of characters in the text (e.g., "Power BI" → 8).

Text	Length
Power BI	8
Data Analysis	13
Report	6

2.2

First Characters

Extracts a specified number of characters from the beginning of the text (e.g., first 5 characters of "Power BI" → "Power").

Text	First 5 Chars
Power BI	Power
Data Analysis	Data
Report	Repor

2.3

Last Characters

Extracts a specified number of characters from the end of the text (e.g., last 2 characters of "Power BI" → "BI").

Text	Last 2 Chars
Power BI	BI
Data Analysis	is
Report	rt

2.4

Range

Extracts characters from a specific starting position for a specified number of characters (e.g., starting at position 3, extract 4 characters).

Text	Start	Count	Result
Power BI	3	4	wer
Data Analysis	6	5	Analy
Report	2	4	epo

2.5

Text Before Delimiter

Extracts all the text that comes **before** a specified character (delimiter) (e.g., before "@" in "john@gmail.com" → "john").

Email	Before "@"
john@gmail.com	john
ravi@avd-group.in	ravi
support@company.com	support

2.6

Text After Delimiter

Extracts all the text that comes **after** a specified character (delimiter) (e.g., after "@" in "john@gmail.com" → "gmail.com").

Email	After "@"
john@gmail.com	gmail.com
ravi@avd-group.in	avd-group.in
support@company.com	company.com

2.7

Text Between Delimiter

Extracts the text that falls between two specified characters (delimiters) (e.g., between "(" and ")" in "Sales(2026)" → "2026").

Text	Between "(" and ")"
Sales(2026)	2026
Report(2025)	2025
Data(1001)	1001

Key Takeaways

- Use **Merge Columns** to combine multiple columns into one.
- Select more than one column (CTRL + Click) to enable **Merge Columns**.
- Extract** helps you get specific parts of a text value (length, first/last characters, range, or by delimiter).
- Useful for cleaning, transforming, and preparing data for analysis.
- No formulas needed — just a few clicks!

Extract
only the data
you need!

Decisions

1 Statistics in Power Query

Overview

Statistics is an option in Power Query (under the Transform tab, for number columns) that lets you quickly apply common statistical calculations to a numeric column, without writing any formula — helpful for getting quick summaries of your data.

Select a number column and use the Statistics option under Transform tab.

Available Options

- ✓ Sum
- ✓ Minimum
- ✓ Maximum
- ✓ Median
- ✓ Average
- ✓ Standard Deviation
- ✓ Count Values
- ✓ Count Distinct Values

Power Query Screenshot

What Each Option Does?

- ✓ **Sum** – Adds up all the values in the column.
- ✓ **Minimum** – Returns the smallest value in the column.
- ✓ **Maximum** – Returns the largest value in the column.
- ✓ **Median** – Returns the middle value when all values are sorted.
- ✓ **Average** – Calculates the mean (average) of all values.
- ✓ **Standard Deviation** – Measures how much the values vary.
- ✓ **Count Values** – Counts the total number of values (including duplicates and blanks).
- ✓ **Count Distinct Values** – Counts the number of unique (non-repeating) values.

2 Standard in Power Query

Overview

Standard is an option in Power Query (under the Transform tab, for number columns) that lets you perform basic mathematical operations on a numeric column, without writing any formula.

Available Options

- ✓ Add
- ✓ Subtract
- ✓ Multiply
- ✓ Divide
- ✓ Divide (Integer)
- ✓ Modulo
- ✓ Percentage
- ✓ Percent Of

Power Query Screenshot

What Each Option Does?

- ✓ **Add** – Adds a specific number to every value.
- ✓ **Subtract** – Subtracts a specific number from every value.
- ✓ **Multiply** – Multiplies every value by a specific number.
- ✓ **Divide** – Divides every value by a specific number.
- ✓ **Divide (Integer)** – Divides and returns only the whole number part.
- ✓ **Modulo** – Returns the remainder after dividing by a number.
- ✓ **Percentage** – Calculates the percentage of every value based on a number.
- ✓ **Percent Of** – Calculates what percentage one value is of another number.

3 Rounding in Power Query

Overview

Rounding is an option in Power Query (under the Transform tab, for number columns) that lets you round off numeric values — either to the nearest whole number, up, down, or to a specific number of decimal places — without writing any formula.

Available Options

- ✓ Round
- ✓ Round Up
- ✓ Round Down

Power Query Screenshot

What Each Option Does?

- ✓ **Round** – Rounds to the nearest number based on decimal places.
Example: 23.567 → Round to 2 decimals → 23.57
- ✓ **Round Up** – Always rounds the value up.
Example: 23.12 → Round Up (0 decimals) → 24
- ✓ **Round Down** – Always rounds the value down.
Example: 23.98 → Round Down (0 decimals) → 23

Use Rounding to make your data neat and consistent!

Information Option in Power Query

Check the properties of your
numeric data — No formulas needed!

1 What is Information?

Information is an option in Power Query (under the **Transform** tab, for number columns) that checks a specific property of each value and returns a TRUE/FALSE or simple result, without writing any formula.

Useful for quick data
checks and validation!

2 Available Options

2 Is Even

2 Is Odd

+/- Sign

3 Where to Find?

Go to **Transform** tab → **Information** dropdown (for number columns).

4 Is Even

Checks if a value is an even number;
returns TRUE or FALSE.

Example:

Number	Is Even
2	TRUE
3	FALSE
4	TRUE
7	FALSE

5 Is Odd

Checks if a value is an odd number;
returns TRUE or FALSE.

Example:

Number	Is Odd
2	FALSE
3	TRUE
4	FALSE
7	TRUE

6 Sign

Checks whether a value is positive,
negative, or zero, and returns
1 (positive), -1 (negative), or 0.

Example:

Number	Sign
10	1
-5	-1
0	0
25	1

Power Query Screenshot

Power Query Screenshot

Power Query Screenshot

Key Takeaways

- Information option helps you check numeric data properties.
- Options available: **Is Even**, **Is Odd**, **Sign**.
- Returns TRUE/FALSE or simple numeric result.
- Useful for data validation and quick analysis.
- No formulas needed — just a few clicks!

Make Your Data
Smarter!

- Validate numeric values
- Identify even/odd numbers
- Check positive/negative/zero

Power Query – Date Option

Transform | Clean | Analyze | Better Data | Greater Insights

Learn
Practice
Grow
SucceedTurn Data
Into Better
Decisions

1

What is Date Option?

Date is an option in Power Query (under the **Transform** tab, for date/date-time columns) that lets you extract or calculate specific date-related details from a date column, without writing any formula.

Helps you work with date and time data easily and quickly!

2

Available Options

- ✓ Age
- ✓ Date Only
- ✓ Parse
- ✓ Earliest
- ✓ Latest
- ✓ Year (Year, Start of Year, End of Year)
- ✓ Month (Month, Start of Month, End of Month, Days in Month, Name of Month)
- ✓ Quarter (Quarter of Year, Start of Quarter, End of Quarter)
- ✓ Week (Week of Year, Week of Month, Start of Week, End of Week)
- ✓ Day (Day, Day of Week, Day of Year, Start of Day, End of Day, Name of Day)
- ✓ Combine Date and Time

3

Where to Find?

Go to **Transform** tab → **Date** (for date/date-time columns).

4

Age

Calculates the difference between the date and today's date (how old the date is).

Result: Returns number of days.

5

Date Only

Removes the time part and keeps only the date.

Result: Returns date without time.

6

Parse Date/Time

Converts text into a proper date/time format.

Result: Converts text to date/time.

7

Year

Extracts the year from the date (e.g., 2026).

Result: Returns the year.

8

Start of Year

Returns the first date of that year.

Result: Returns the first date of the year.

9

End of Year

Returns the last date of that year.

Result: Returns the last date of the year.

Key Takeaways

- ✓ Date option helps you extract or calculate date-related details.
- ✓ Useful for data cleaning, transformation and analysis.
- ✓ No formulas needed — just a few clicks!
- ✓ Options include Age, Date Only, Parse, Year, Month, Quarter, Week, Day and more.

Why It's Useful?

- ✓ Simplifies date and time transformations
- ✓ Saves time and effort
- ✓ Helps in better data analysis
- ✓ Works with date and date-time columns

with Dates,
Build Better
Insights!”*

1

Month Transformations in Power Query

Work with months easily
using Power Query!

?

What are the options?

There are different options available for **Month**. Those are:

- ✓ Month
- ✓ Start of Month
- ✓ End of Month
- ✓ Days in Month
- ✓ Name of Month

These options help you extract useful month-related information from a date column.

1

Month

Extracts the month number (e.g., 5 for May).

Date	Month
1/5/2024	1
2/14/2024	2
3/20/2024	3
4/18/2024	4
5/10/2024	5

2

Start of Month

Returns the first date of that month.

Date	Start of Month
1/5/2024	1/1/2024
2/14/2024	2/1/2024
3/20/2024	3/1/2024
4/18/2024	4/1/2024
5/10/2024	5/1/2024

3

End of Month

Returns the last date of that month.

Date	End of Month
1/5/2024	1/31/2024
2/14/2024	2/29/2024
3/20/2024	3/31/2024
4/18/2024	4/30/2024
5/10/2024	5/31/2024

4

Days in Month

Returns the total number of days in that month.

Date	Days in Month
1/5/2024	31
2/14/2024	29
3/20/2024	31
4/18/2024	30
5/10/2024	31

5

Name of Month

Returns the month name (e.g., "May").

Date	Month Name
1/5/2024	January
2/14/2024	February
3/20/2024	March
4/18/2024	April
5/10/2024	May

2

Quarter Transformations in Power Query

Analyze your data by quarters
with ease!

?

What are the options?

There are different options available for **Quarter**. Those are:

- ✓ Quarter of Year
- ✓ Start of Quarter
- ✓ End of Quarter

These options help you extract useful quarter-related information from a date column.

1

Quarter of Year

Returns which quarter the date falls in (1-4).

Date	Quarter
1/5/2024	1
4/18/2024	2
7/10/2024	3
10/25/2024	4

2

Start of Quarter

Returns the first date of that quarter.

Date	Start of Quarter
1/5/2024	1/1/2024
4/18/2024	4/1/2024
7/10/2024	7/1/2024
10/25/2024	10/1/2024

3

End of Quarter

Returns the last date of that quarter.

Date	End of Quarter
1/5/2024	3/31/2024
4/18/2024	6/30/2024
7/10/2024	9/30/2024
10/25/2024	12/31/2024

!

Important Note

- ✓ For Append to work properly, the tables should ideally have the same column names. If a column exists in one table but not in another, Power Query will still combine them, but the missing values will appear as blank (null) for that column.

✓

Key Takeaways

- ✓ Use Month and Quarter options to quickly extract date information.
- ✓ Helps in creating time-based reports.
- ✓ Useful for analysis like monthly/quarterly sales, trends, and comparisons.
- ✓ Saves time and reduces manual calculations.

💡

Pro Tip

- ✓ You can also create custom columns using these date functions to build calculated fields like:
 - ✓ Month-Year (e.g., May 2024)
 - ✓ Quarter-Year (e.g., Q1 2024)
 - ✓ Financial Year
 - ✓ And more...
